

## NORAM DRILLS ONE OF DEEPEST STEP-OUT HOLES TO DATE: INTERSECTING MINERALIZED CLAYSTONE & NEW LITHOLOGIES

Vancouver, British Columbia – November 29, 2023– Noram Ventures Inc. (“Noram”) (TSX – Venture:NRM / Frankfurt: N7R / OTCQB: NRVTF) is pleased to announce the completion of the first of its 10 hole drill program; referred to as CVZ-82. CVZ-82 was drilled to a depth of 555ft (169.2m), with an intersection of approximately 338.5 ft (103.2m) of favourable claystones and volcanics.

This program is designed to:

1. Better define the high-grade core of the currently known lithium clay deposit.
2. Test the southwest extension of the high-grade zone.
3. Test whether there exists a second, deeper lithium clay deposit beneath the currently known deposit.
4. Further define the structures and bedding angle of the sediments in the projected northwest pit area.
5. Test the mineralization depth and potential location of a possible mineralizing structure on the southeast side of the deposit.
6. Obtain geotechnical information.

*Figure 1 – BRE geologist washing the CVZ-82 core prior to logging and splitting the core for assay.*

Core hole CVZ-82 was completed by contract drilling company Titan Drilling of Elko, Nevada, at a depth of 555 feet (169.2 m), one of the deepest holes completed to date on the property. As such, it intersected some lithologies not previously encountered in the past 6 drilling campaigns because they occur deep in the stratigraphic section. The rock types that were new to the program were of volcanic origin and included some rock types interpreted as lapilli tuffs. The tuffs are believed to be the primary source of lithium within the mudstones. Also new to the program were some basal lithified gravels in the deepest parts of the hole (Figure 1). The gravels are thought to be a basal unit on top of the Paleozoic “basement” rocks, but this has not yet been confirmed. The program is being managed by geologists and engineers from Big Rock Exploration LLC (“BRE”) of Minneapolis, Minnesota, USA.

With the completion of CVZ-82, the drill has moved to CVZ-83 and drilling is in progress. Sampling of the core using an industry standard QA/QC protocol is underway. Samples are to be delivered to ALS Laboratories in Reno, Nevada for assaying. Assay results are pending.

## CVZ-82

Figure 2 – Generalized strip log of CVZ-82 showing lithologies encountered in the core.

“While our program is focused on understanding the exciting theory of the presence of a second layer of mineralization at depth, we also included several vital step-out holes. These holes are crucial to validating our new geological model and supporting the size and extent of the resource we are dealing with. At this point we have just revealed and begun to understand the tip of the iceberg” stated Sandy MacDougall, Executive Chairman and Director.
